Models of Madness

Psychological, Social and Biological
Approaches to Psychosis

Second Edition

Edited by **John Read**, University of Liverpool, UK
and **Jacqui Dillon**, National Chair, Hearing Voices Network, UK

Series: *The International Society for Psychological and Social
Approaches to Psychosis Book Series*

"Truly, a revolution is occurring in our understanding of severe mental illness... This volume will serve as an inspiration, not only to established clinicians and researchers, but to the young people who will develop better services for people with psychosis in the future."

- **Richard Bentall, From the Foreword**

Are hallucinations and delusions really symptoms of an illness called 'schizophrenia'? Are mental health problems really caused by chemical imbalances and genetic predispositions? Are psychiatric drugs as effective and safe as the drug companies claim? Is madness preventable?

This second edition of *Models of Madness* challenges the simplistic, pessimistic and often damaging theories and treatments of the 'medical model' of madness. Psychiatric diagnoses and medications are based on the false premise that human misery and distress are caused by chemical imbalances and genetic predispositions, and ignore the social causes of psychosis and what psychiatrists call 'schizophrenia'. This edition updates the now extensive body of research showing that hallucinations, delusions etc. are best understood as reactions to adverse life events and that psychological and social approaches to helping are more effective and far safer than psychiatric drugs and electroshock treatment. A new final chapter discusses why such a damaging ideology has come to dominate mental health and, most importantly, how to change that.

Models of Madness is divided into three sections:

- Section One provides a history of madness, including examples of violence against the 'mentally ill', before critiquing the theories and treatments of contemporary biological psychiatry and documenting the corrupting influence of drug companies
- Section Two summarises the research showing that hallucinations, delusions etc. are primarily caused by adverse life events (eg. parental loss, bullying, abuse and neglect in childhood, poverty, etc.) and can be understood using psychological models ranging from cognitive to psychodynamic
- Section Three presents the evidence for a range of effective psychological and social approaches to treatment, from cognitive and family therapy to primary prevention.

This book brings together thirty-seven contributors from ten countries and a wide range of scientific disciplines. It provides an evidence-based, optimistic antidote to the pessimism of biological psychiatry. *Models of Madness* will be essential reading for all involved in mental health, including service users, family members, service managers, policy makers, nurses, clinical psychologists, psychiatrists, psychotherapists, counsellors, psychoanalysts, social workers, occupational therapists, and art therapists.

SELECTED CONTENTS: Part I: The Illness Model of Psychosis and 'Schizophrenia'. Part II: Social and Psychological Approaches to Understanding Madness. Part III: Social and Psychological Approaches to Responding to Madness.

May 2013: 400pp.
